PROFESSIONAL SUMMARY

Full-stack engineer with 4+ years building real-time trading, betting and automation systems end to end. Took five products from zero to live at DG3 since Sep 2024 - a sportsbook, a Polymarket-based prediction market and a trading terminal - together handling \$13M in cumulative volume with a \$1M peak day. In parallel I run KAVX, my own ecommerce brand, on an event-sourced agent platform I built that prices, advertises and restocks it unattended.

ACHIEVEMENTS

- Built and sold a real business, engineered end to end.** Took KAVX from zero to its first 100 units sold at positive unit margin - every pricing move, ad bid and restock decided by the automation platform I wrote, behind a human approval gate.
- Shipped a profitable algorithmic trading system.** Python + Rust bot for Polymarket's CLOB running live and in profit: a Rust WebSocket hub (clob-ws-rs) feeding a shared-memory backend, a maker-grid market-making strategy, and a Kelly-sized risk layer validated on paper trading against live feeds before capital went in.
- Five production products in under two years.** Sole front-end owner across DG3's betting and prediction-market line and backend owner on the newest, moving \$13M in volume - including a full Azuro SDK v7 migration across a live sportsbook with no downtime.
- Made a marketplace agent-operable.** Built a Model Context Protocol server over the Flipkart Seller API, exposing catalog, orders, pricing, ads and analytics as typed, agent-callable tools - now the surface a live commerce business runs on.

WORK EXPERIENCE

DG3 - Full-Stack / Web3 Engineer New Delhi, India | Sep 2024 - Present
Own the front end across five betting and prediction-market products; own front end and backend on the newest.

- DG Terminal (real-time sports trading terminal):** built the Next.js / TypeScript / Zustand front end - order book, positions panel and an edge finder that surfaces mispriced markets - plus the NestJS + PostgreSQL backend for positions, trades and summaries with ingestion and order-reconciliation workers. Engineered the real-time layer: parallel WebSocket subscriptions per open bucket, price caching and stale-market handling.
- DG3 Predictions (prediction market):** integrated Polymarket CLOB and builder-relayer SDKs; built the socket-driven order book, PnL history and charting, cross-chain USDC deposit flows with relay support, and resolution via UMA's Optimistic Oracle; onboarding on ZeroDev account abstraction and Privy.
- DG3 Sportsbook (crypto, on-chain):** primary front-end engineer for on-chain betting on Azuro and Overtime; led the Azuro SDK v7 / toolkit v6 migration; built the fraud-detection system (device fingerprinting, VPN/Tor/incognito detection, Cloudflare-fronted proxy routing, geo signals) and multi-currency wallets with Privy, Glide, Transak and LiFi swaps, extended to Solana and Sui.
- Hardened the API with Helmet, HPP, input sanitisation and class-validator schemas; owned Sentry triage to closure across releases, including a Zustand feedback loop causing React error #185 in production.

KAVX - Founder / Engineer New Delhi, India | Jul 2026 - Present
Own ecommerce brand on Flipkart, plus the event-sourced automation platform that runs it.

- Reached the first 100 units sold at positive unit margin with pricing, ads, inventory and daily ops running unattended - margin-aware bidirectional pricing with a return-aware floor, a SKU-profit ad bid engine with a conversion-gap guard, and one stock pool allocated across listings rather than replicated.
- Designed the decision pipeline so automation is auditable and reversible: strategies emit ActionSuggested, a human approves, the action lands in a transactional outbox in the same DB transaction, then executes with idempotency keys on every marketplace write; guardrails refuse an approved batch that would oversell a stock pool.
- Built the platform beneath it - multi-tenant PostgreSQL with row-level security, an append-only event store with projections, BullMQ workers and cron jobs, resilient pagination with 429/5xx retries - TDD throughout with Vitest in a Turborepo monorepo, designed from day one to generalise into a seller SaaS.

NFTFN - Full-Stack Developer Remote | Mar 2023 - Sep 2024
Built the trading UX for an order-book perpetual DEX in React, wagmi and Web3, adding WebSockets for real-time order updates and Subgraph for efficient on-chain reads.

- Raised code integrity through a reusable component system, testing standards and code review, and led front-end direction to milestone delivery.

Web3 Citadel - Software Developer Remote | Apr 2022 - Mar 2023
Built DApps in React, Next.js, TypeScript, Tailwind and Web3.js with a reusable component library; integrated REST and on-chain data for dynamic blockchain interaction; led feature delivery and debugging.

PROJECTS

- Polymarket Trading Bot** (Mar - May 2026) - Algorithmic market-making system for Polymarket's CLOB. Rust clob-ws-rs crate feeding a shared-memory backend consumed by a Python core, shipped as a multi-stage Docker build; maker-grid strategy with its own order manager and PnL settler; risk layer with Kelly-multiplier sizing, cluster protection, time-window and RSI entry filters. **Output:** running live and profitable, with written PnL-bleed audits after paper-trading validation against live feeds.
- NewClickBeauty** (Apr - Aug 2026) - Luxury cosmetics storefront on Next.js App Router, Prisma/PostgreSQL, Auth.js email-OTP with USER/ADMIN roles, Zustand cart and PhonePe payments. **Output:** a complete DTC sales channel shipped solo - verified-purchase reviews with transactional aggregate caching, an admin moderation and feedback inbox, technical SEO (SSR, schema, collections) and consent-first GA4 instrumentation.

SKILLS

- Frontend:** React, Next.js, TypeScript, JavaScript, Zustand, Redux Toolkit, React Query, Tailwind CSS, SCSS, Radix UI, Framer Motion
- Backend & Data:** NestJS, Node.js, Express, PostgreSQL (row-level security), Prisma, MongoDB, Redis, REST, GraphQL, Socket.IO, BullMQ, event sourcing, transactional outbox, idempotency, Turborepo
- Blockchain / Web3:** viem, wagmi, ethers.js, Web3.js, Subgraph, EVM chains, Solana, Sui, account abstraction (ZeroDev, permissionless), Privy, Azuro, Overtime, Polymarket CLOB, UMA Optimistic Oracle
- AI & Automation:** Model Context Protocol server design, agent-callable tool schemas, human-in-the-loop approval loops, algorithmic trading strategies and risk sizing, cron/launchd scheduling, Google Sheets and Telegram Bot APIs
- Real-time & Ops:** WebSocket feeds, order books, price caching, stale-data handling, Sentry, WebEngage, Docker (multi-stage), CI/CD, Git, Vitest, TDD, security hardening (Helmet, HPP, RLS, input sanitisation)
- Languages:** TypeScript, JavaScript, Python, Rust (working level), SQL

EDUCATION

Full-Stack Web Development (Bootcamp), Masai School, Bangalore - Jul 2021 - Feb 2022
BA English, University of Delhi, New Delhi - 2020 - 2023
